

12.2 The Structure of DNA

Lesson Summary

The Components of DNA DNA is a nucleic acid made up of nucleotides joined into long strands or chains by covalent bonds. Nucleotides may be joined in any order.

- ▶ A DNA nucleotide is a unit made of a nitrogenous base, a 5-carbon sugar called deoxyribose, and a phosphate group.
- ▶ DNA has four kinds of nitrogenous bases: adenine, guanine, cytosine, and thymine.

Solving the Structure of DNA

- ▶ Erwin Chargaff showed that the percentages of adenine and thymine are almost always equal in DNA. The percentages of guanine and cytosine are also almost equal.
- ▶ Rosalind Franklin's X-ray diffraction studies revealed the double-helix structure of DNA.
- ▶ James Watson and Francis Crick built a model that explained the structure of DNA.

The Double-Helix Model The double-helix model explains Chargaff's rule of base pairing and how the two strands of DNA are held together. The model showed the following:

- ▶ The two strands in the double helix run in opposite directions, with the nitrogenous bases in the center.
- ▶ Each strand carries a sequence of nucleotides, arranged almost like the letters in a fourletter alphabet for recording genetic information.
- ▶ Hydrogen bonds hold the strands together. The bonds are easily broken allowing DNA strands to separate.
- ▶ Hydrogen bonds form only between certain base pairs—adenine with thymine, and cytosine with guanine. This is called **base pairing**.

The Components of DNA

For Questions 1–5, complete each statement by writing in the correct word or words.

1. _____ The building blocks of DNA are _____.
2. Nucleotides in DNA are made of three basic components: a sugar called _____, a _____, and a nitrogenous _____.
3. DNA contains four kinds of nitrogenous bases: _____, _____, _____, and _____.
4. In DNA, _____ can be joined in any order.
5. The nucleotides in DNA are joined by _____ bonds.

Solving the Structure of DNA

6. Complete the table to describe each scientist's contribution to solving the structure of DNA.

Scientist	Contribution
Erwin Chargaff	
Rosalind Franklin	
James Watson and Francis Crick	

7. Complete the table by estimating the percentages of each based on Chargaff's rules.

DNA sample	Percent of adenine	Percent of thymine	Percent of guanine	Percent of cytosine
1	31.5			
2		30	20	
3				17

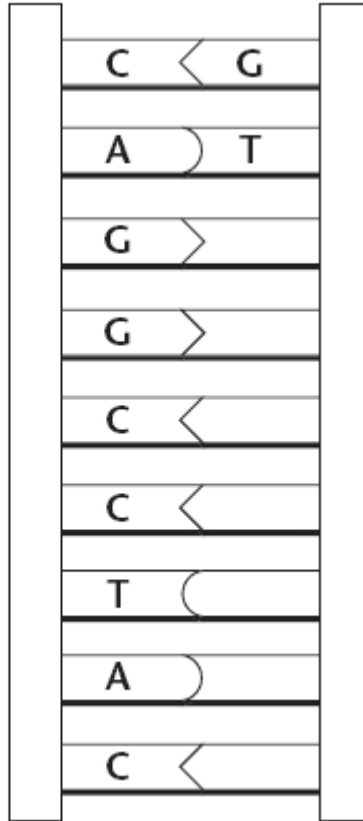

The Double-Helix Model

For Questions 8–13, on the lines provided, label the parts of the DNA molecule that correspond to the numbers in the diagram.

14. **THINK VISUALLY** Drawing below shows half of a DNA molecule. Fill in the appropriate letters for the other half.

Key	
A	= Adenine
C	= Cytosine
G	= Guanine
T	= Thymine

The Role of DNA

Storing Information The main job of DNA is to store genetic information. Genes must have the information needed to produce traits such as eye color or blood type.

15. Make a list of six things about this dog that are controlled by its DNA.

1. _____
2. _____
3. _____
4. _____
5. _____
6. _____

16. Complete this graphic organizer to summarize the assumptions that guided research on DNA in the middle of the twentieth century. Use an oak tree to give an example of each function.

Function:	Function: Copying information	Function:
Why this function is important:	Why this function is important:	Why this function is important:
